Abstract (en)
Interior space of cooling chamber (1) which is developed by this invention is separated into at least two different compartments (2, 3, 4), by at least one separator (5). Said separator (5) consists of at least two parts (8, 9a). At least one spring (11) is placed on at least one of said parts (8, 9a) and it pushes other part (9a, 8). One single spring gap (10) can be formed on parts (9a, 8), for placement of each spring (11) on parts. There is an air flow gap (12) on at least one of the parts (8, 9a) for adjustment of temperature of each compartment (2, 3, and 4). The compartments (2, 3, 4) formed by means of separator (5) can be in different sizes and temperatures by adjustment of said space (12).
