Abstract (en)

[origin: EP2375214A1] The device has connecting and spacing units (5, 6) arranged between a ballistic protective element (4) and an opening frame i.e. rear door (2). The connecting units drive connection of the ballistic protective element and the rear door during opening of the rear door. The spacing units cause separation of the ballistic protective element and the rear door when the rear door is closed. The spacing units comprise spacers interposed between the ballistic protective element and a vehicle door face.
