Abstract (en)
[origin: WO2010080025A1] Supporting device (128), comprising at least one substantially plate-like support body (3, 9), and at least one tilting mechanism which bears the support body (3, 9), for load by a user on a side of the support body (3, 9) opposite the tilting mechanism. The support body (3, 9) is tiltable here about a tilt axis defined by the tilting mechanism and in a loaded state is oriented in accordance with the load. The device is distinguished from the known device in that it comprises: at least three support bodies (9), each carried by a tilting mechanism. The support bodies are thus centred on the load, and the comfort of a user is increased.
