Abstract (en)

[origin: WO2010066719A1] A condensation device (5) for a drier comprises a heat exchanging unit (10), a positioning frame (13) and a connector (14). The heat exchanging unit (10) comprises at least one drying air channel (11) formed from a heat conductive material and at least one cooling air channel (12) disposed at one side of an air channel. The connector (14) has a containment slot (23) for receiving the positioning frame(13). The positioning frame(13), the connector (14) and the heat exchanging unit (10) are mutually fixed by direct connection. Because the positioning frame(13), the connector (14) and the heat exchanging unit(10) are mutually fixed by direct connection, the three components are fixed in a single step and the manufacturing process is simplified.
