Abstract (en)
[origin: WO2010066524A1] The invention relates to a door handle arrangement for a motor vehicle having a handle component that has a handle (1) and at least one fastener section (3, 4) connected to the handle. The fastener section can be coupled to a fastener receptacle arranged in a door of the motor vehicle. A first conductive coil, the winding of which surrounds a hub (16) arranged in the handle component, is arranged in the handle component, wherein the hub extends at least partially in the fastener section (3, 4) of the handle component. In the region of the fastener receptacle on the vehicle side, a second conductive coil is designed such that the hub arranged in the handle component (16) extends through the second coil upon coupling of the fastener section to the fastener receptacle.
