Abstract (en)
[origin: EP2378513A1] The method involves measuring a physical parameter with a reference sensor (2) dependent on time for the primary sound source (1), which characterizes the sound-generating motion of the emitting surface of the primary sound source. The corresponding time-dependent reference parameters (q-pq-t) are obtained, which comprise the phase information of the primary sound source. The secondary sound source (6) is controlled with a time-dependent driving signal. An independent claim is also included for an active noise reduction system for active noise reduction of a sound field generated by a swinging emitting surface of a primary sound source.
