Abstract (en)

[origin: WO2010085202A1] The invention refers to a door system for sides of a load platform, incorporating a number of stanchions (3a, 3c) detachably attached to an upper supporting rail (1) and a lower carrying rail (2), each of which stanchions supports a first door leaf (5a), which is pivotally supported about a first pivot axis extending in the longitudinal direction of the stanchion, and a second door leaf (5b), which is pivotally supported about a second pivot axis extending in the longitudinal direction of the stanchion and which is spaced apart from the first pivot axis, whereby each one of the said first and second door leafs (5a, 5b) at its longitudinal side facing away from said first and second door leaf resp., supports a pivotally arranged third (5c) and fourth door leaf (5d), and that between door leaf and carrying rail (2) are provided contact members (10), which are displaced from the center of the pivot axis for the purpose of giving the mutually foldable door leafs a self-locking effect.
