Abstract (en)

[origin: EP2208701A1] The method involves entering a destination call or receiving an identification code on a call entry floor. The destination call or the identification code designates an arrival floor. A trip by elevator cabins (1,1',1") from a departure floor to an arrival floor is determined. The fulfillment of a situation-specific parameter is determined before determining a trip. A situation-compatible call assignment is determined for a trip having a floor difference of zero between the call entry floor and the departure floor, if the situation-specific parameter is fulfilled. An independent claim is also included for a computer program product with a computer program unit for a computer-readable data storage.
