Abstract (en)
[origin: EP2381167A2] The headlamp has a cylindrical casing comprising a covering shaft that is arranged between a reflector and a lens. A protrusion unit (60) is extended away from one of focal lines (21) for dim light in a circumferential or rotational direction of the covering shaft. Normal distance of the cylindrical casing to a rotation axis is smaller than normal distance of a cylindrical shaped casing surface of the covering shaft, where a section of the focal line for dim light lies at the latter distance. The light exhibits reduced gap to the rotation axis.
