Abstract (en)  
[origin: EP2381174A1] The element has lower and upper plates (1, 2) made from steel and arranged at a top part, where the plates are tightly bonded with each other in edge areas. A meandering channel (3) is formed between the plates for guiding a cooling medium through the cladding element. The upper plate or lower plate is designed as a milled sheet with a meandering milled slot (4) that forms the channel, where a side of the upper plate facing away from the lower plate comprises a weld plating (5). The channel has channel sections running over entire length and breadth of the element.
