Abstract (en)

[origin: WO2010086539A1] The invention relates to a cover for a road system device provided with a frame, including: a blocking member (32) and a base body (16) defining a covering surface (20) for the road system device, extending in a cover plane (T-T), and having a recess (28; 28P, 28I) for receiving the blocking member (32). The recess and the blocking member are adapted for blocking the cover relative to the frame (4) or to a neighbouring cover (8; 6P, 8). The recess (28; 28P, 28I) is adapted for maintaining the blocking member (32) relative to the base body (16) in an independent manner, and for resisting the movement of the blocking member along a direction (S) extending perpendicular to the cover plane (T-T) and tending to move the blocking member (32) away from the covering surface (20). The invention can be used for manholes for accessing underground facilities.
