Abstract (en)
[origin: WO2010069340A1] From a container sealed in a pressure-tight manner, liquid is withdrawn by way of a dispensing device having a spigot pipe and a bushing. In the storage and transport position, the spigot pipe is lowered into the bushing. It can be pulled out into a stand-by position, in which a flow path through the spigot pipe can be blocked and released by an actuating movement. The actuating movement denotes a bending of the spigot pipe out of the stretched position thereof and back into the same.
