Abstract (en)  
[origin: EP2385206A2] The arrangement has a set of switching members (2) that are interconnected at contact points in a resting position. The switching members are made from a non-conducting base body and formed with a concave retainer (8) at an end. A convex end of the switching members is provided with a centrally formed conductive region i.e. metal insert (22). Rotation of the convex end under influence of external force is adapted to resiliently bias movement of a contact pin (26) of the conductive region to separate the conductive connection of between conducting area and the pin.
