Abstract (en)

[origin: EP2206847A1] The panel (1) has a cleat (6) comprising an end attached to a rib (4). A portion of the cleat adjacent to the end has a width smaller than that of another part that is adjacent to a free end of the cleat. Contours of the parts form a projection at a junction between the parts and at a predetermined distance from one of the ends of the cleat. The projection forms a stop block (7) to prevent passage of the cleat outside an orifice (5) of a stiffener (3) under an effect of pressure force exerted on a slatted metal sheet (2). The sheet is set at an intersection between the stiffener and the rib. Independent claims are also included for the following: (1) a formwork comprising two panels connected by connection elements (2) a slab comprising reinforcement frameworks and a concrete layer arranged on a face of a panel (3) a tooling for setting a set of stiffeners at a slatted sheet.
