Abstract (en)

[origin: EP2386333A1] The element has a lever (20) co-operating with a notching part by a cam, so that an actuation of the lever allows positioning of the notching part along two bottom and top positions corresponding respectively to a configuration of adjusting and blocking the fixation element on a board. The notching part includes an opening extended transversely, and is crossed by an axle of the lever, where the axle of the lever includes a cam forming part cooperating with an interior surface of the opening of the notching part. Independent claims are also included for the following: (1) a device for fixing a shoe on a sliding board, comprising a stop (2) a method for assembly a fixation element.
