Abstract (en)

[origin: EP2386455A1] An improved system for testing of railway track has sensors (8) fitted to a support frame (7) rigidly mounted onto at least one axle (2) of a rail vehicle. The mounting limits the lateral displacement of the sensors and prevents the sensors being displaced, e.g. when moving over switching points. The sensors can be US, eddy current or other conventional designs. Double axle mountings include a torsion link.
