Abstract (en)  
A slatted bed (1) having movable slats, comprising: - a plurality of slats (2), extending transversally so as to define a resting plane, wherein each slat has a central body (20) and two end side portions (21, 22); and - oblique guide slots (3) associated to elastic loops (50), which slots define a plurality of paths for the end side portions of the slats, which paths are mutually divergent with respect to the transverse center line of the bed, the overall arrangement being such that, when the gravitational load related to the subject's weight is applied on the slats, the end side portions move in the oblique paths so as to spread apart the slats themselves.
