Abstract (en)

[origin: EP2388379A1] The device has small and large actuation keys (1, 2) for a flush activator mounted in an actuation plate (3). The keys are movable from an initial position into an end position over an actuation distance (S) by the flush activator. A lever (6) transfers movement of the keys into a compressed rod (7) of a drain valve. The lever is designed such that the lever covers an actuation path, which is larger than the actuation distance of the keys, during actuation of the keys. Large force is transferred over an actuation distance part (S1) than over another actuation distance part (S2) by the lever.
