Abstract (en)  
[origin: EP2390442A1] The invention relates to a lock system comprising a mechanical lock comprising: a lock casing comprising a first bolt being movable between an unlocked position in which the first bolt is fully comprised by the lock casing and a locked position in which the first bolt is partially located outside the casing; a first electromechanical actuator connected to the bolt, which first electromechanical actuator is arranged to move the first bolt from the unlocked position to the locked position in response to receiving an electrical pulse; and a second electromechanical actuator that in response to receiving an electrical pulse enables the first bolt to move from the locked position to the unlocked position.
