Abstract (en)

Device and method to fasten a removable cross piece, a so called glazing bar (2), against a door or window frame or similar frame piece (3) which is cased with a frame profile (4). The device is a clip (1), which includes a male element that is designed to cooperate with the standard solutions existing by the glazing bars (2) for the attachment between the clip (1) and the glazing bar (2). The clip (1) includes a base surface (7) with a tie-back (8) which is arranged to be fitted in between the frame profile (4) and the seal (5), and that the tie-back (8) is arranged to grip around the corner (15) of the frame profile (4) whereby the clip (1) is in engagement between the frame profile (4), and the seal (5). In that way sufficient friction and engagement between the frame profile (4) and the seal (5) is obtained when the clip (1) is fitted in between the frame profile (4) and the seal (5), which in turn results in that the glazing bars (2) in its mounted position don't moves out of its position along the frame profile (4) when the clip (1) is loaded by the own weight of the glazing bars (2).
