Abstract (en)

[origin: EP2392219A1] The glove (1) has a set of rigid protection elements, each arranged between an outside covering i.e. skin (2) and a lining at an end of a finger of the glove to protect last phalanx of a finger of a hand inserted into the glove. Each element has a shape of a sheath (3) extending coaxially at the finger of the glove. The sheath with a blind has a partially closed end (4) to form a limit stop of a user's finger introduced in the sleeve by an open end (5) of the sheath. The sheath has a tubular body formed by a wall whose thickness is not constant between the open end and the closed end.
