Abstract (en)

[origin: WO2010089337A1] The invention relates to an apparatus (100) and to a method for performing a load test in an elevator installation (10), which comprises an elevator car (11) and a counterweight (12), which are connected to one another by means of supporting means (13). Furthermore, the elevator installation (10) comprises a drive brake (18) in order to be able to halt the elevator car (11) during a downwards journey. The apparatus (100) comprises a connecting element (102) for fastening to the counterweight (12), an element with spring properties (103) and a tensioning means (101) for installation in the elevator installation (10). One point of the tensioning means (101) can be fixed on a stationary point (P1) of the elevator installation (10) via the element with spring properties (103). Another point of the tensioning means (101) can be connected to the counterweight (12) via the connecting element (102), wherein the tensioning means (101) comprises actuating means (104) which make it possible to tension the element with spring properties (103) in order to thereby exert a downwardly directed tensile stress (F) on the counterweight (12).
