Abstract (en)

[origin: WO2010088752A1] A security device for use in association with a security pin includes a tag body, a spring lock and a magnetic lock. The tag body has a body aperture formed therein adapted to receive the security pin. The spring lock is situated within the tag body and has a spring lock aperture formed therein in registration with the body aperture. The spring lock is adapted to engage the security pin when in an engaged position and release the security pin when in a released position. The magnetic lock is within the tag body and has a magnetic lock aperture. The magnetic lock is adapted to engage the security pin when in an engaged position and to release the security pin when in a release position. The spring lock and the magnetic lock need to both be in the released position to successfully remove the security pin from the security device. A detaching device to move the spring lock and the magnetic lock into the released such that they are both in the release position at the same time is also shown.
