Abstract (en)
[origin: WO2010089177A2] The invention relates to a household refrigeration device (HK) having at least one receiving chamber (AR) for goods to be refrigerated, wherein the receiving chamber (AR) is delimited at the edges by walls (W) which are provided for supporting carrying parts (T) that have a pattern of openings (D) and can be introduced into the receiving chamber (AR). Backing pieces (H) are associated with the walls for reinforcement and sealing. The household refrigeration device is designed such that backing pieces (H) are provided in each case with a circular symmetrical seal (1) which surrounds an opening (D) in the assembled position can be deformed to different deformation levels depending on the wall thickness.
