Abstract (en)
[origin: WO2010089272A1] The invention relates to a device (100) for detecting the passing of individuals in the form of a mat including: a printed circuit (104), one of the surfaces of which supports a plurality of contactors provided to change the state thereof under the pressure exerted by a foot or a wheel, and at least one of the surfaces of which supports at least one electronic component (112) not subjected to any pressure from said foot; and - for the or each surface supporting at least one electronic component (112), a protective layer (106) attached to said surface and incompressible under the weight of individuals/trolleys, the or each electronic component (112) being recessed in a hole (110) in said incompressible protective layer (106).
