Abstract (en)
[origin: EP2395170A1] The invention relates to a device for mounting glass bricks (2) of the type used in construction, characterised in that it is based on positioning a preferably-plastic section (1, 11, 26) on the sides of the brick that are to be joined to other bricks (2) and joining the aforementioned sections (1, 11, 26) to the sections (1, 11, 26) of the adjacent bricks (2) using a double-armed, cross-shaped element (3, 13, 27). The invention is advantageous in that the connection system between the plastic sections (1, 11, 26) positioned against the sides of the bricks (2) and the cross elements (3, 13, 27) is produced simply and quickly by means of simple insertion, thereby enabling the user to mount the bricks, dispensing with the need for labour and, consequently, reducing costs.
