Abstract (en)

[origin: EP2395403A2] The timepiece i.e. wristwatch (1) has time indication moving parts positioned concentrically and connected to timepiece movement to be driven with different periodicities, where the movement includes a cam that is fixed to one of the moving parts and another cam that is fixed to a time indicator hand and rotated with respect to the former cam. An actuating unit makes a lever engaging with the latter cam to shift the hand to a position. A resilient return unit is engaged with the former cam to return the hand to another position when the lever engages with the latter cam.
