Abstract (en)
[origin: EP2395492A1] The method involves placing a group of receivers in storage mode for allowing the acquisition of a new identifier of a new wireless control. The new control is actuated for emitting the new identifier. The new identifier is stored by each receiver in the group while conserving a preceding identifier in an additional memory. The new identifier stored in the receiver is erased and the preceding identifier is conserved when the new identifier received by the receiver corresponds to the preceding identifier.
