Abstract (en)

[origin: WO2010092275A1] The invention relates to a device for classifying a battery produced by assembling electricity-accumulating elements (1, 2, 3, 4, 5) divided into groups. In the device, a component (22) is provided for evaluating the degrees of ageing, each of which is associated with a distinct group, and for allocating, to the battery, in accordance with statistical distribution parameters of the evaluated degrees of ageing, a classification level that is representative of the potential performances of the battery during use.
