Abstract (en)
[origin: EP2398115A1] The front plate for a socket comprises a front surface having at least one first plane surface part and at least one aperture through which a plug may be inserted into the socket. A lid is adapted to close said aperture when no plug is inserted in the socket. The lid is adapted to perform a sliding motion between a first position where said aperture is closed and a second position where said aperture is open so as to allow insertion of the plug. The sliding motion is a non-linear sliding motion between said first position and said second position, the lid being, in the second position, located in front of and overlapping said front surface.
