Abstract (en)

[origin: WO2010085977A1] The present invention concerns a system as well as a method for the evaluation of the vestibular functionality in a subject. The system comprises a display unit for showing a visual target such as an optotype to the patient, a device for measuring rotational acceleration that rotates integrally with the patient's head, and a recording unit. The method of the invention may also be suitably used for the rehabilitation of the peripheral vestibular functionality.
