Abstract (en)

[origin: WO2010094302A1] In order to be able to perform the transfer of electrical energy between an electrical energy store (20) of an electric car (13) and a connection point (e.g. 12d) of an electrical power distribution grid using relatively less effort, particularly with regard to the technical construction of the connection point (e.g. 12d), a method is proposed for controlling the transfer of electrical energy between an electrical energy store (20) of a vehicle and a connection point (e.g. 12d) of an electrical power distribution grid, wherein an electrical connection is produced between the electrical energy store (20) and the connection point (e.g. 12d), a communication connection is produced between a communication device (23) associated with the vehicle and a communication service provider (15), the electrical energy is transferred between the electrical energy store (20) and the connection point (e.g. 12d) during the period of time that the communication connection exists at constant average electrical power, and the transfer of the electrical energy and the communication connection are terminated at the same time.
