Abstract (en)  
[origin: WO2010094780A1] A sheet metal lid (1) for fixing to a container body, the lid (1) comprising a centre panel (2) surrounded by a seaming portion (4), which is adapted to be joined to the periphery of the container body after it has been filled with a product. The centre panel (2) defines an aperture (7) through which the product may be dispensed from the container. The aperture (7) is designed to accommodate a separate closure and the cut edge of the aperture (7) is curled to protect a user from cuts and to provide an aperture curl, which engages with the separate closure provide a fluid tight seal. The closure moves relative to the centre panel between a closed position, in which the aperture and the closure together form a fluid-tight seal, and an open position, in which the seal is broken and the closure moves relative to the centre panel to open at least part of the aperture.
