Abstract (en)

[origin: WO2010094502A1] The invention relates to a device for separating disc-shaped elements from a stack (2). The device has a first belt conveyor device (6) and a second belt conveyor device (7). The first belt conveyor device (6) is provided for receiving in each case one disc-shaped element from a stack (2). The second belt conveyor device (7) is provided for further transport and for the depositing of the disc-shaped elements on a transport device (8) which leads further. The first and the second belt conveyor devices (6, 7) are connected to a device (VP) which generates a vacuum. A first belt of the first belt conveyor device (6) has first openings and a second belt of the second belt conveyor device (7) has second openings. Here, the opening cross sections of the second openings are smaller than the opening cross sections of the first openings.
