Abstract (en)
[origin: CA2752438A1] The invention relates to a drive for a rod-shaped machine element, in particular for the blower tube (1) of a soot blower that is moved axially backwards and forwards and is simultaneously set in rotation. To simplify the drive for a machine element of this type, an elongated, flexible tensile element is provided, preferably a link chain (2) or wire cable, said element being helically guided around the rod-shaped machine element, for example a blower tube (1), with several convolutions (3) and being drivable in both directions.
