Abstract (en)  
[origin: WO2010095999A1] A ventilation device has a body (1) with a through opening and a flat rear contact surface. The ventilation device further has a fan (14), which is arranged in the body and adapted to be mounted indoors on a mounting surface of a wall or a ceiling in such a manner that the contact surface of the body (1) is in close contact with the mounting surface and the opening in the body is positioned right in front of a ventilation duct which opens into the mounting surface. The fan (14) is coaxially arranged in a ring (8), which is pivotally connected to the frame (1) and pivotable about a pivot axis (9), which extends parallel to the contact surface of the body (1), between a position of use, in which the ring (8) is located right in front of the opening in the body (1) and its centre axis extends substantially perpendicularly to the contact surface, and a service position, in which the ring (8) is pivoted away from the opening.
