Abstract (en)
[origin: EP2399856A1] The device (100) has an input side roller arrangement (110) with a set of rollers (111-113) and an output side roller arrangement (120) with another set of rollers (121-124), where the rollers are arranged at respective upper and lower roller plates (130, 140). The rollers of the input side arrangement and the two rollers of the output side arrangement make contact with a cable (1) in a closed position. Force (F) acts on the cable between the two rollers of the input side arrangement perpendicular to a transport direction (X). A cylinder pivots the upper plate relative to the lower plate. An independent claim is also included for a method for operating a straightening device.
