Abstract (en)  
[origin: EP2401941A1] The guide has a driver guided between two end positions along a guide path (3) at a housing (2). The driver comprises an retainer (40) that is opened in a direction, where a projection (31) of an activator (30) is inserted into the retainer such that the activator is movable together with the driver. The activator is moved independent of the driver in the opening direction. The guide path comprises a cover that is arranged adjacent to a bent end section (46), where movement of the activator from the retainer is prevented by the cover. The cover is integrally formed with the housing.
