Abstract (en)

[origin: EP2402676A2] The method involves conducting heating agent from a heating agent connection into a lower side of a panel-type radiator in a front heating panel (2), a lower collecting channel (12), an upper collecting channel via a standpipe (14), the lower collecting channel via a sink channel, and the upper collecting channel via another standpipe. The agent is conducted from the upper collecting channel into a rear heating panel (4). The agent in the lower collecting channel is divided into two flows, which are separately conducted through the latter standpipe from the front panel and into the rear panel. An independent claim is also included for a panel-type radiator comprising heating panels.
