Abstract (en)

The present invention relates to a telecommunications chip card for carrying personalization data for connection to at least a mobile telecommunication network and comprising at least an applet manager and at least a first applet. The telecommunications chip card further comprising means for receiving a registration of a first handset entity from a chip card reader to a first applet manager; means for forwarding the registration from the first applet manager to the at least first applet; means for sending at least a first control data from the at least first applet to the first applet manager and means for forwarding the at least first control data from the first applet manager to the chip card reader for comparison of the at least first control data with a first data event related to a digital data broadcast by the first handset entity. The telecommunications chip card further comprises: means for receiving at least a portion of the first data event from the first handset entity through the chip card reader to at least the first applet manager, if the portion of the first data event corresponds to at least the first control data; means for forwarding the portion of the first data event from the first applet manager to at least the first applet; means for processing the portion of the first data event for generating a first return signal by at least the first applet and means for sending a first return signal from at least the first applet to the first applet manager.
