Abstract (en)

[origin: WO2010100092A2] The invention relates to a gondola drive (1) for a floating device (16) having an underwater housing (2) circulated around by water, comprising a drive module (3) having a drive module housing (4) and a shaft (5) arranged therein, a transmission module (6) having a transmission module housing (7) and a transmission (8) arranged therein and a propeller (9). The drive module (3) and the transmission module (6) are each designed as separate components connected to one another such that the drive module housing (4) and the transmission module housing (7) form at least a part of the underwater housing (2) and that the shaft (5) is coupled to the transmission (8) for driving the propeller (9).
