Abstract (en)
[origin: WO2010100361A1] The invention relates to a device for assembling the components of a panel antenna, including at least one volumetric radiating element comprising a leg, above which a radiating plane is provided, and at least one component of the mechanical structure of the antenna. The device includes a dielectric part that comprises a central area including a first attachment means engaging with the radiating member, side areas including second attachment means engaging with longitudinal edges of the component of the mechanical structure of the antenna, and an intermediate area including a third flexible connection means between the first attachment means and the second attachment means.
