Abstract (en)

[origin: WO2010100365A1] The invention relates to a method for producing an antenna, operating in a given frequency band, from a dual-band antenna. According to the method, the dual-band antenna is a broadband slot antenna (1) that receives and/or transmits electromagnetic signals at a first frequency and at a second higher frequency. The antenna is powered by a single power supply line (3), and the free end of the power supply line is connected, by a connection means that can be opened or closed, to at least one means (4, 5) for rejecting one of the frequencies. The invention can be used in producing generic electronic boards.
