Abstract (en)

[origin: WO2010109003A1] The invention relates to a lock, in particular mortise lock with a pusher nut (5) which, in a basic position, is supported with a supporting flank (8) on an eccentric body (10) which can be rotated about an adjustment axis in order to change the rotational position of the pusher nut (5) in the basic position thereof. In order to improve the adjustment of the angular position of the pusher handle, it is proposed that the eccentric body (10) can be rotationally fixed in the respective rotational positions thereof with the aid of a locking screw (20) wherein the locking screw (20), is screwed from the outside through an opening (31) in the lock cover (2) into an internal thread (18) formed by a threaded socket (16) and the head (21) of the locking screw is supported on the lock cover (2).
