Abstract (en)

[origin: EP2415603A1] The device (9) has a support including an engagement edge that extends in a side of the support along axial direction of a form cylinder (2). A holding unit holds a printing mold (16) that is guided to the cylinder, where the holding unit is designed as a clamping piece that is connected with a shaft. The mold is locked in the engagement edge that is formed on a slot, where the locking of the printing mold is remotely controlled. The clamping piece is pivoted from a position to release the slot to another position to hold a suspension leg of the mold by a rotational movement of a shaft.
