Abstract (en)

[origin: EP2416585A2] A method for controlling a pair of shutter glasses (100) includes controlling each of a first shutter lens and a second shutter lens (102, 104) to be switched between an on-state and an off-state, wherein the first shutter lens (102, 104) stays in the on-state within an image output period corresponding to a secondary first image, and stays in the off-state with an image output period corresponding to a following primary second image, and the second shutter lens (102, 104) stays in the off-state within the image output period corresponding to the primary second image, and stays in the on-state within an image output period corresponding to a following secondary second image. The first shutter lens and the second shutter lens (102, 104) simultaneously stay in the off-state only within a single continuous time period of the image output period corresponding to the primary second image.
