Abstract (en)

[origin: WO2011050540A1] The present invention relates to a method in a wireless communication system for determining quality of service (QoS) fulfilment of one or more data flows between a first communication node (N1) and a second communication node (N2) in a wireless communication system, wherein said one or more data flows are transmitted on at least one radio link between said first (N1) and second (N2) communication nodes, and each data flow is associated with one or more quality of service (QoS) attributes, said method comprising the steps of: measuring at least one measurement value for each one of said one or more quality of service (QoS) attributes; comparing said at least one measurement value for each one of said one or more quality of service (QoS) attributes to a corresponding threshold value for obtaining one or more satisfied or non-satisfied representations; and determining the quality of service (QoS) fulfilment of said one or more data flows based on said one or more satisfied or non-satisfied representations. The invention also relates to a computer program, a method in a communication node, and a communication node apparatus thereof.
