Abstract (en)

[origin: WO2010118817A1] The invention relates to a method for contamination-free docking of a first at least partially flexible package (10) to a second at least partially flexible package (10'). The packages (10, 10') consist of films, at least in part, having outer sides (12) that can be solidly welded, and inner sides (14) can be detachably welded. According to the invention, a solid connection between the packages is produced outside the detachably welded inner sides in order to create a channel between the packages. The channel is opened by loosening the connection between the inner sides.
