Abstract (en)
[origin: WO2010118805A1] A lock device has a locking mechanism to which a combination lock (1) belongs and a rotary unit (2) to which a secondary lock (3) belongs. In order to ensure that the combination wheels of the combination lock are displaced out of the position corresponding to the key combination, following the setting of the key combination and the opening of the lock, and in order to be able to find again an unknown or lost key combination with comparatively little effort, the invention proposes that the locking device have both a key combination setting device, by means of which the key combination of the combination lock can be set in the event that the key combination is lost, and also have a key combination discard device, by means of which, following the setting of the key combination of the combination lock, the combination lock can be displaced out of the key combination.
