Abstract (en)
[origin: WO2010118938A2] The invention relates to a refrigeration device (10), in particular a refrigerator or freezer, having a housing (12), which encloses an inner compartment which is cooled with respect to the surroundings, and at least one window (16). In order to prevent fogging, it is proposed for at least one window (16) and/or a frame element (18) of the housing accommodating said window to be provided at least in some regions with panel heating, which enables local and homogeneous heating of the window (16) and/or the frame element (18) and thus prevents fogging.
